

News portal

In order to show your frontend technical skills, please build an application capable to integrate the public API of the New York Times (<http://developer.nytimes.com/>).

The project must have instructions on how to run the application.

The portal should have:

- A landing page with the last news;
- The landing page should have a search;
- The landing page should have filters and pagination.
- A details page where you can view in detail specific news (please do not redirect to the external website).

Recommended technologies

- Vue.js (our main frontend framework);
- Angular;
- React.

Topics to take into account:

- Code standards and clean code;
 - Software patterns;
 - User-friendly;
 - Usage feedback (e.g. loading state, error handling);
 - Responsive UI;
 - Routing;
 - Unit tests;
 - Functional tests.
-
- Amaze us :)

Notes:

Please don't push the exercise to GitHub or other version control. You should send the exercise by google drive or other file shared system.
